Anavar is a fast-acting steroid derived from DHT (dihydrotestosterone) with a life of only 8 to 10 hours. It has long been a widely used, respected and very popular steroid. One of the few steroids that can also be used by women due to its mild androgenic effects. Anavar is mildly toxic to the liver, as expected from an oral steroid, but the level of hepatotoxicity is minimal compared to many other steroids, making it an ideal choice for beginners. While Anavar has a strong anabolic rating, it is also not as effective a bulking steroid for men as other steroids. While it can contribute to bulking with high-quality weight gain without water retention, Anavar is most potent both as a cutting steroid and for enhancing athletic performance. Women who use Anavar can find that it can add impressive lean muscle gains to the physique and is the main anabolic steroid suitable for women to use for this purpose. There are many reasons for Anavar's popularity: This is an oral steroid so it is easy to administer Can be used by both men and women Has minimal side effects compared to many other steroids Most importantly, it has extraordinary benefits for those who know exactly what they are using it for, and almost often this is done with the aim of improving physique and increasing performance through fat loss while preserving muscle mass.
